

## About me

I design digital products and systems that operate reliably at scale. My work sits at the intersection of **product strategy**, **UX**, and **technical delivery**, where clarity, buildability, and long-term sustainability matter as much as visual craft. I'm interested in how design decisions hold up over time — not just how they look at launch, but how they support teams, users, and organisations as products evolve.

I operate comfortably across strategy and execution, partnering closely with product and engineering teams to define direction, shape complex workflows, and translate intent into solutions that can be built, maintained, and extended. I've worked across a range of contexts, including

**regulated and high-complexity environments**, where constraints are real, trade-offs are unavoidable, and design decisions need to be made with a clear understanding of technical and organisational impact.

My approach to design is deliberately systems-led. Rather than optimising individual interfaces in isolation, I focus on reducing **cognitive and organisational friction**, creating **reusable patterns**, and designing structures that scale across teams, platforms, and use cases. This often means investing time upfront in information architecture, design systems, and workflow design so teams can move faster later without losing coherence or quality.

More recently, this has included designing human–AI workflows that support decision-making and production while maintaining transparency, trust, and ownership. I'm less interested in novelty than in leverage — **using automation** and **AI** where they reduce effort, improve consistency, or remove bottlenecks, and avoiding them where they introduce risk or ambiguity.

I'm most effective in environments where teams value clarity over ceremony, align early around intent and constraints, and expect design to contribute not just ideas, but decisions. I work best when design is treated as a practical discipline — one that balances user experience, technical reality, and business outcomes to create products that stand up to real-world use.

## Experience Snapshot

Product Strategy · UX · Systems Design

I've worked across the full lifecycle of digital products, from **early problem framing and discovery** through to delivery and iteration. My experience spans **B2B**, **SaaS**, and **consumer-facing platforms**, often in environments with **technical, regulatory, or organisational complexity**.

Rather than treating **strategy**, **UX**, and **execution** as separate phases, I work to connect them — translating user needs and business goals into systems, patterns, and workflows that teams can sustain over time. This includes defining **product direction**, shaping information architecture, and designing frameworks that scale across platforms and teams.

I've led work independently and in collaboration with cross-functional teams, partnering closely with **product managers**, **engineers**, and **stakeholders** to align on priorities, make informed trade-offs, and deliver outcomes that hold up in production.

## Tools & Technology

Applied, pragmatic, and delivery-aware

I use tools as leverage, not as an identity. My focus is on choosing and combining technologies that **reduce friction**, **improve clarity**, and support teams in shipping reliable products.

My day-to-day work typically involves:

- Designing and maintaining **scalable design systems** and component libraries
- Working in **high-fidelity prototyping** and **production-ready design workflows**
- Collaborating closely with **engineering** to ensure design decisions translate cleanly into implementation

In recent work, I've also incorporated **AI-assisted** and **automation-enabled workflows** to accelerate research synthesis, documentation, and repetitive production tasks. These are applied selectively, with an emphasis on transparency, reviewability, and trust rather than novelty.

I'm comfortable working close to the technical layer and adapting design practices to fit the **constraints and realities of modern product development**.

## Clients & Domains

Cross-industry, high-context environments

I've worked with organisations across **finance**, **healthcare**, **education**, **entertainment**, and **consumer technology** — from early-stage teams to established global brands.

Much of my experience sits in **high-context environments**, including **regulated industries** and **data-heavy platforms**, where design decisions need to account for compliance, scale, and long-term maintainability.

Across these contexts, my role has consistently been to bring clarity: aligning stakeholders, reducing unnecessary complexity, and designing systems that teams can confidently **build**, **evolve**, and **extend**.

## How I See Design Today

Design beyond interfaces

Design today is less about isolated interfaces and more about how decisions are made, communicated, and sustained over time.

As products and organisations grow more complex, the value of design shifts toward **systems thinking** — creating structures that help teams move faster without losing coherence, and introducing **automation or AI** in ways that support people rather than obscure accountability.

I see design as a **practical discipline**: one that balances **user needs**, **technical constraints**, and **business realities**. Good design reduces friction, makes intent explicit, and enables better outcomes not just at launch, but months and years later.

The designers who create the most impact today are those who can operate across boundaries — between strategy and execution, humans and machines, ambition and constraint.

## UX Audit & Strategic Redesign: Translating Complexity into Clarity

- ★ UX audit & competitive analysis
- ★ Information architecture redesign
- ★ Design system strategy & implementation
- ★ Cross-platform usability testing
- ★ Stakeholder alignment & workshops

| Role            | Contribution                | Relationship                 |
|-----------------|-----------------------------|------------------------------|
| Product Manager | Strategy, priorities, KPIs  | Aligned on IA-first approach |
| Lead Developer  | Implementation, performance | Responsive patterns          |
| Brand Team      | Visual identity, guidelines | Design system rules          |
| QA Lead         | Testing, edge cases         | Validated UX improvements    |
| Research Team   | User testing, analytics     | Provided user feedback loops |

Palmerbet is an Australian bookmaker offering sports and racing markets across web and mobile. As the platform evolved, users experienced friction navigating between devices. The problem was straightforward: inconsistent design patterns, redundant navigation, and poor information hierarchy created a **fragmented experience**. Users switching between mobile and desktop encountered different visual systems, buried features like My Stable, and competing visual priorities that caused cognitive overload.

The core challenge wasn't building new features. It was **unifying an ecosystem** that had grown chaotic; translating platform complexity into clarity without losing the sophistication power users expected.

The figure displays three screenshots of the 'LIVE TRIP' application. The top-left screenshot shows the main interface with a 'LIVE TRIP' banner, a 'My Trip' section containing a table of trip details, and a 'My Profile' section. The top-right screenshot shows a 'My Profile' screen with a 'My Profile' button and a 'My Profile' section. The bottom-right screenshot shows a 'My Profile' screen with a 'My Profile' button and a 'My Profile' section.

The diagram illustrates the relationship between Generalizable and Comprehensive models. Generalizable models are characterized by being able to generalize to new scenarios, having a simple and interpretable structure, and being robust to noise and outliers. Comprehensive models are characterized by being able to capture complex patterns, having a high capacity for fitting data, and being able to handle a wide range of data types. The diagram shows that Generalizable models are a subset of Comprehensive models.

- Generalizable**
  - Ability to generalize to new scenarios
  - Simple and interpretable structure
  - Robust to noise and outliers
- Comprehensive**
  - Ability to capture complex patterns
  - High capacity for fitting data
  - Ability to handle a wide range of data types

[illegible]

MY THINKING

Rather than redesigning every screen, I needed to diagnose why the experience felt broken. I started with a UX audit, not to list problems, but to identify root cause.

**Key insight:** The issue wasn't visual clutter. It was information architecture. Users needed a clear mental model before they needed a polished interface. If users didn't understand where to find a live event or how betting types were organized, no amount of visual refinement would help.

**Decision:** Lead with IA, not aesthetics.

THE APPROACH

- 1. Audited user flows to map friction points (first-time better → placing a live bet)
- 2. Redesigned information architecture: What should users encounter when? What's primary vs secondary?
- 3. Built a scalable design system around the clearer structure (spacing, typography, components)
- 4. Tested the mental model with users to validate the structure stuck
- 5. Iterated responsively based on cross-platform testing (scroll controls, icon libraries, dark mode support)

KEY THINKING

When a product feels broken, don't redesign the surface. Diagnose the architecture first. **Fix the structure, then design the interface.** A coherent information architecture makes good UI inevitable; bad IA makes even beautiful design ineffective.

THE OUTCOME

23% reduction in early drop-off

50% faster mobile navigation

87% preferred new design

Same mental model for web and app

KEY RESPONSABILITIES

- ★ UX audit & user research facilitation
- ★ Information architecture redesign
- ★ Responsive navigation system design
- ★ Design system strategy & iconography
- ★ Cross-device testing & validation

TEAM & COLLABORATION

| Role                 | Contribution                            | Relationship                      |
|----------------------|-----------------------------------------|-----------------------------------|
| Product Manager      | Strategy, business goals, KPIs          | Mobile-first approach             |
| Lead Developer       | Front-end frameworks, tech. constraints | Prototyped interactions together  |
| Financial Compliance | Regulatory requirements                 | Ensured all designs met standards |
| Design System Lead   | UI patterns, scalability                | Built consistent components       |
| User Research        | Testing, analytics, user feedback       | Provided validation data          |

THE CHALLENGE

Brightday was Australia's first all-in-one investment platform for advisors, fund managers, and investors. The legacy design was desktop-first and dated. As mobile usage grew, the dense information hierarchy broke down on smaller screens; users couldn't access key financial data without excessive scrolling. Satisfaction was low (2/5 average), and users visited only to complete single tasks before leaving.

**The core challenge:** How do you show 8+ sections of financial data on a 375px screen without removing information that power users needed?

MY THINKING

The instinctive answer was to simplify mobile by hiding information. But that missed the insight: users on mobile still needed everything. The issue wasn't data density. It was context.

**Key insight:** Information hierarchy isn't fixed. It changes based on device (desktop vs mobile) and user type (advisor vs investor). Design for context, not just size.

**Decision:** Use the same navigation logic across devices. On desktop: left sidebar. On mobile: bottom dock. Same structure, different context.

THE APPROACH

- 1. Audited legacy platforms to understand what information mattered in each workflow
- 2. Mapped user workflows on each device (what do users actually do on mobile vs desktop?)
- 3. Designed a sticky dock: persistent, customizable, accessible with one hand
- 4. Restructured desktop navigation to mirror the dock concept for consistency
- 5. Made the dock customizable per user: users reordered based on their workflow priority
- 6. Built a scalable design system with consistent iconography to support third-party integrations

KEY THINKING

Responsive design isn't about scaling interfaces. It's about understanding context and user intent. When you map workflows carefully across devices, the responsive solution becomes obvious. Same structure, different context.

THE OUTCOME

- 50% mobile friction eliminated
- 7k+ new active users year one
- 94% migration from legacy
- 70% wishlist adoption increase

Legacy site

Dock solution exploration

# LoanInsights

Mobile-First Redesign: From Calculator Tool to Engagement Platform

## KEY RESPONSABILITIES

- ★ UX research & discovery facilitation
- ★ User journey mapping & personas
- ★ Mobile-first interaction design
- ★ Progressive onboarding strategy
- ★ Marketing-to-design integration

## TEAM & COLLABORATION

| Role               | Contribution                      | Relationship                    |
|--------------------|-----------------------------------|---------------------------------|
| Product Manager    | Goals, metrics, roadmap alignment | Linked design to business KPIs  |
| Frontend Developer | API integration, live data        | Search & map features           |
| Data/ Analytics    | User behaviour insights           | Provided dropout analysis       |
| Marketing Lead     | Campaign strategy, follow-ups     | Co-designed engagement pathways |
| Property Data Team | API access, feature scope         | Smart search functionality      |

## THE CHALLENGE

LoanInsights offered useful tools but suffered from high abandonment, poor mobile usability, and no clear path to conversion. Users arrived with intent but dropped off before reaching the calculator or signing up. The existing site was static, a tool, not a platform. It didn't leverage the property data APIs available to the business, and it treated conversion as a one-time event rather than an ongoing engagement opportunity.

The challenge was clear: transform a calculator from a utility into a customer acquisition engine while removing barriers to exploration.

Navigation

Property report

MY THINKING

Analytics revealed the core problem wasn't feature-poor tools. It was psychology: users resisted logging in early, and long forms created abandonment friction, especially on mobile.

**Key insight:** Delay the ask. Let users see value before requiring commitment. A user who sees their loan estimate is psychologically different from a user staring at a login screen.

**Secondary insight:** Engagement doesn't end at conversion. Behavior-triggered follow-ups (saved suburbs, completed calculations) could turn a one-time tool into a recurring platform.

THE APPROACH

- 1. **Progressive onboarding:** moved login to after the calculator, removing psychological friction
- 2. **Smart search:** integrated live property data directly into the search bar for instant, location-based suggestions
- 3. **Guided form wizard:** replaced long forms with micro-interactions (sliders, toggles) optimized for mobile
- 4. **Mobile-first design:** prioritized touch interactions and readability across devices
- 5. **Action-oriented outcomes:** added pathways to request reports or schedule broker calls, creating new revenue channels
- 6. **Strategic follow-ups:** worked with marketing to design behavior-triggered emails (incomplete calculations, favourite suburbs, property alerts)

KEY THINKING

Remove the barrier between curiosity and value. Let users explore before asking for commitment. Then use behavior signals to create ongoing engagement. A calculator is a one-time tool. A platform designed around user behavior becomes recurring.

THE OUTCOME

38%

increase in traffic

53%

growth in conversions

75%

activated geolocation

x2

email open rates

# La Liga

## AI & Automation: Designing Trust in Automated Systems

Implementation details have been intentionally abstracted to focus on design decisions, system behaviour, and outcomes rather than specific configurations.

### KEY RESPONSABILITIES

- ★ System mapping & workflow analysis
- ★ AI/human handoff design
- ★ Automation framework strategy
- ★ Interaction patterns & guardrails
- ★ Organizational change enablement

### TEAM & COLLABORATION

| Role                 | Contribution                     | Relationship                       |
|----------------------|----------------------------------|------------------------------------|
| Innovation Team Lead | AI strategy, technology          | Aligned on human-centered approach |
| Engineering & Data   | Implementation, API integration  | Collaborated on system patterns    |
| Communications Team  | Content workflows, needs         | Co-designed video automation       |
| Analytics Team       | Reporting requirements, insights | Built data visualization framework |
| Executive Leadership | Governance, roadmap alignment    | Positioned AI as friction-reducer  |

### THE CHALLENGE

Despite digital maturity, La Liga teams relied on manual processes: meetings produced unstructured information, reports required repeated formatting work, and internal updates were delivered in long documents nobody read. This created delays, inconsistent documentation, and high operational overhead.

The challenge wasn't "How do we add AI?" It was "How do we introduce automation in a way people trust?"

## AI Video Podcast (Internal Communications)

### Problem

Written internal newsletters were time-consuming to produce and often skimmed or ignored.

### Solution

I designed an automated internal video news format that transformed structured updates into short, branded video content optimised for quick consumption.

The system converted internal updates into scripts, generated voice narration, and assembled content using pre-defined visual templates.

The format was intentionally designed to be concise, consistent, and accessible, replacing long written updates with short visual narratives.

### Outcome

- ~70% reduction in internal communication workload
- Higher engagement compared to written updates
- Reduced reliance on manual content production

### Effort vs Engagement Shift

|                    |                                                                                    |                    |
|--------------------|------------------------------------------------------------------------------------|--------------------|
| Written Newsletter |   | Manual, text-heavy |
| Automated Video    |  | Automated, visual  |

### From Written Updates to Automated Video

Internal Updates

Structured Content

AI Script & Voice

Branded Video

## Meeting Intelligence Agent

### Problem

Meetings generated valuable insights, but decisions and actions were often lost or inconsistently documented.

### Solution

I designed an end-to-end meeting intelligence workflow that captured conversations, extracted key topics and actions, and produced structured follow-up artefacts.

Outputs were intentionally delivered in familiar formats (documents and slides) to minimise friction and encourage adoption among non-technical teams. AI supported summarisation and classification, while humans retained review and decision control.

### Outcome

- ~4 hours saved per week per team
- Improved consistency and clarity of documentation
- Clearer accountability and follow-through

### Defined Human-AI Responsibilities

Automation Supports  
Capture and transcription  
Summarisation  
Topic and action extraction

Humans Retain Control  
Validation  
Prioritisation  
Ownership and follow-through

### From Conversation to Action

Live Conversation

Automated Capture & Structuring

Review & Validation

Actionable Outputs

MY THINKING

The common mistake: Build the AI solution, then convince people to use it. That builds resistance, not adoption.

**My approach:** Start with the human problem. What's actually slowing teams down? Then design automation around that specific friction, with humans staying in control.

**Key insight:** AI adoption isn't about the technology. It's about solving real friction and building trust through clarity.

**Decision:** AI handles capture, summarization, and synthesis. Humans retain validation, prioritization, and ownership. This builds trust.

THE APPROACH

- 1. **Facilitated system-mapping workshops** to identify high-friction workflows (meetings, reporting, internal updates)
- 2. **Designed clear human-AI handoffs** for each workflow:
  - AI captures and structures
  - Humans validate and prioritize
  - Humans own decisions
- 3. **Output in familiar formats:** Documents, Slides, branded videos—to reduce adoption friction
- 4. **Made guardrails explicit:** "AI does X, humans do Y", no hidden decision-making
- 5. **Built modular patterns** so workflows could scale and evolve without complexity

**Decision:** Humans keep control of validation, prioritization, ownership. AI handles capture and synthesis only. This builds trust.

KEY THINKING

Automation is most effective when designed for specific human friction, with clear handoffs. People adopt what solves their real problems. Trust comes from transparency about what AI does and what humans control.

THE OUTCOME

4h saved per team per week  
+60% manual work eliminated  
70% communication workload cut  
+AI Foundation for future AI initiatives

Data Visualisation & Reporting Framework

Problem

Executive reporting relied on manual data compilation and formatting, slowing access to insights.

Solution

I designed a reporting framework that unified multiple internal data sources into a single, automated reporting flow. Reports were structured around executive scanning behaviour, prioritising summaries, changes over time, and decision-ready insights.

Outputs were generated in consistent, branded formats to support fast interpretation and reuse across departments.

Outcome

- Near real-time generation of executive reports
- Consistent structure and branding across teams
- Faster access to actionable insights

Designed for How Leaders Read

Markdown-to-Publication Engine

Problem

Design teams were repeatedly pulled into low-value formatting and documentation tasks.

Solution

I designed a text-to-publication system that allowed teams to author content in a lightweight format and automatically generate polished, branded outputs.

This empowered non-technical users to produce high-quality documentation independently, while preserving design standards and governance through templates.

Outcome

- Simplified documentation workflows
- Reduced repetitive design work
- Enabled design teams to focus on higher-value product and experience challenges

Shifting Design Effort to Higher-Value Work

KEY RESPONSABILITIES

- ★ UX research & HCP interviews
- ★ Information architecture design
- ★ Compliance framework architecture
- ★ Content strategy & templating
- ★ AEM (Adobe Experience Manager) optimization

TEAM & COLLABORATION

| Role                     | Contribution                           | Relationship                             |
|--------------------------|----------------------------------------|------------------------------------------|
| Novartis Product Manager | Goals, regulatory strategy             | Aligned on compliance-first architecture |
| Medical/ Compliance Team | Regulatory requirements, content rules | Built color-coded system together        |
| Marketing Manager        | Campaign timing, content focus         | Coordinated specialty launches           |
| Front-end Developer      | AEM constraints, implementation        | Worked within CMS limitations            |
| Medical Writers          | Content creation, accuracy             | Validated templates and workflows        |

THE CHALLENGE

MedHub was a secure platform for healthcare professionals (HCPs) to access pharmaceutical education and resources across 4+ medical specialties. The challenge was complex: support multiple specialties with distinct needs, meet strict compliance (promotional vs educational content separation), work for busy professionals accessing during patient consultations, and comply with pharmaceutical regulations (clear labeling, audit trails).

The tension: How do you build flexible and delightful UX when regulatory constraints are non-negotiable and technical constraints are real (Adobe Experience Manager)?

SPECIALTIES

**USER BEHAVIOUR CONTEXT**  
Research revealed HCPs need:

**Device Preferences:** Desktop-heavy (80% work hours), mobile/iPad during patient consultations

**Time of Use:** Context-driven access (work hours vs in-session with patients)

**Customization & Personalization:** Content filtered by specialty, access patterns

**INFORMATION ENGAGEMENT**  
What HCPs actually consume:

**Product Information:** Clinical details, efficacy, safety data

**Educational Materials:** How-to guides, operational procedures, clinical evidence

**General Information:** Specialty overview, latest research findings

**Events:** On-site conferences, online webinars, educational sessions

**Video Content:** Expert interviews, procedure walkthroughs, conference highlights

CONTENT ENGAGEMENT ARCHITECTURE

The compliance layer that makes everything work:

MY THINKING

Many teams treat compliance as a constraint that limits design. I treat it as a design requirement that informs architecture.

**Key insight:** Compliance requirements don't limit good UX. Clear compliance architecture often enables better UX by making intent explicit. The solution isn't hiding complexity. It's structuring it so users never see it.

**Decision:** Build the compliance framework first, then design UX on top. Don't bolt it on afterward.

THE APPROACH

- 1. **Built the compliance framework first:**
  - Color-coded content types (blue=product info, purple=educational, green=promotional)
  - Clear separation at architectural level, not just visual
  - Audit trail built into system foundation
- 2. **Designed specialty navigation** around the compliance structure:
  - Dermatology, gastroenterology, rheumatology, hematology, etc.
  - Customizable content streams per specialty
  - Unified templates that accommodated variation
- 3. **Tested with real HCPs** to ensure:
  - Compliance was invisible (users didn't see complexity)
  - Access was fast (even during patient consultations)
  - Professional trust was high (clear separation of content types)
- 4. **Worked within AEM constraints** to build a maintainable, scalable system that felt modern

KEY THINKING

In regulated industries, compliance isn't the enemy of good UX. It's an opportunity to clarify intent and build trust. Design systems that make compliance visible at the architecture level, then build delightful UX on top. Users will feel the clarity.

THE OUTCOME

4.9 therapy areas scaled +300 HCPs first month  
+1.4k enrolled within 2 years 23 online events during COVID

MedHub Homepage: Specialty Navigation

Ophthalmology Hub: Available Therapy Areas

Vital Signs Homepage: Cardiovascular Specialty Hub

Vital Signs Content Library: PI + Educational Pathway

Breezhaler Product Campaign: Promotional Messaging

Conversations in Rheumatology: Event Landing Page

PUBLIC ACCESS LAYER

**What it is:** Novartis corporate branding, open access

**Purpose:** Entry point for all HCPs, builds trust through brand authority

BRANDED SPECIALTY PAGES

**What it is:** Specialty sub-brands (like "Vital Signs" for cardiology) with distinct visual identity

**Purpose:** Specialized content for authenticated users, premium experience

PROMOTIONAL & EVENT FORMATS

**What it is:** Campaign materials and event landing pages (promotional top, events bottom)

**Purpose:** Time-sensitive, engagement-driving content with clear regulatory separation

## AbbVie Pro

Enterprise healthcare platform for HCP engagement

AbbVie Pro was a secure digital platform designed to support healthcare professionals with access to product information, educational resources, and events across multiple therapy areas.

I worked on the UX design within a highly regulated pharmaceutical environment, contributing to information architecture, content structuring, and component patterns that could scale across brands and regions.

The work required close alignment with compliance, medical, and marketing teams to ensure consistency, governance, and long-term maintainability while supporting diverse HCP needs.

[abbviepro.com.au](http://abbviepro.com.au)

## Adama

Lifecycle-driven product awareness for Australian farmers

I worked on a nationwide digital campaign for Adama, designing a multichannel experience that connected product awareness, regional targeting, and CRM-driven follow-up within a highly regulated agricultural context.

The work focused on aligning messaging with seasonal decision cycles, geographic constraints, and compliance requirements, ensuring farmers received relevant product information at the right time and place. Design decisions prioritised clarity, trust, and direct connection to local representatives, using flexible landing page systems and geotargeted content to support both acquisition and repeat engagement.

The campaign strengthened lead quality and engagement while demonstrating how design, data, and regulation can work together to support lifecycle-driven outcomes rather than one-off promotion.

[adama.com.au](http://adama.com.au)

## eLearning & LMS

Designing scalable learning platforms and content systems

I've worked across multiple eLearning and LMS platforms, designing learning experiences for professional training, compliance, and skills development.

My focus has been on structuring content for clarity and progression, designing reusable learning patterns, and supporting diverse learner needs across devices. This included course frameworks, assessment flows, and content templates that balanced instructional goals with usability, accessibility, and long-term scalability.

## OneVue

Corporate website & investor platform for financial services

I worked on the redesign of OneVue's corporate website and investor platform as the business prepared for an ASX listing. The challenge was to modernise the site while clearly serving multiple audiences — experienced investors, first-time investors, and potential shareholders; within strict financial compliance requirements.

The work focused on structuring information and pathways to reduce cognitive load, build trust, and support decision-making at different levels of financial literacy. This included separating educational content from investor reporting, introducing tailored journeys for each audience, and establishing a scalable design system that could support future products and partnerships. The platform supported both the IPO campaign and long-term corporate growth, reinforcing credibility while remaining accessible on mobile-first experiences.
